# **Mark Scheme**

Q1.

| Question<br>number | Answer  | Additional guidance   | Mark |
|--------------------|---|---|------|
| (i)                | Working: Use of $\frac{T^2}{r^3}$ $T^2$ for Io = $(1.77 \text{ days})^2 = 3.13 \text{ days}$ (1) $r^3$ for Io = $(421600 \text{ km})^3 = 7.49 \times 10^{27}$ (1) $\frac{T^2}{r^3}$ = Constant X for Io = same constant X for Europa = $4.17638 \times 10^{-17}$ (1) $r^3$ for Europa = $670900^3 = 3.02 \times 10^{17}$ (1) $T^2$ for Europa = $12.6$ T for Europa = $3.55 \text{ days}$ (1) | Award full marks for correct numerical answer without working  Accept values that round to 4 days | (5)  |

| Question<br>number | Answer  | Additional guidance   | Mark |
|--------------------|---|---|------|
| (ii)               | Convert to km from AU $0.0012 \text{ AU} = 180000 \text{ km } (1)$ Calculation of $\frac{T^2}{r^3}$ for Mimas $\frac{0.9^2}{180000^3} =$ = $1.388 \times 10^{-16} (1)$ Divide this by the value for constant X from (b)(i) to find the ratio: $\frac{1.388 \times 10^{-16}}{4.176 \times 10^{-17}}$ Jupiter's mass = $3.325 (3\frac{1}{2}) \times \text{Saturn's mass} (1)$ | Allow ecf  Award full marks for correct numerical answer without working  Accept values that round to 3.3 | (3)  |

## Q2.

| Question<br>number | Answer  | Notes | Marks  |
|--------------------|---|-------|--------|
|                    | 27( years)<br>Evidence of 9 <sup>3</sup> (=729) |       | 2<br>1 |

## Q3.

| Question | Answer   |          |
|----------|--|----------|
| number   |  |          |
|          | (i) A double                                   | (1)      |
|          | B is incorrect because the force of gravity is | (1)      |
|          | proportional to mass                           |          |
|          | C is incorrect because the force of gravity is |          |
|          | proportional to mass                           |          |
|          | D is incorrect because the force of gravity is |          |
|          | proportional to mass                           |          |
|          | proportional to mass                           |          |
|          | (ii) <b>D</b> drop to one quarter              |          |
|          | A is incorrect because the force of gravity is |          |
|          | inversely proportional to distance squared     |          |
|          | B is incorrect because the force of gravity is |          |
|          | inversely proportional to distance squared     |          |
|          | C is incorrect because the force of gravity is |          |
|          |  |          |
|          | inversely proportional to distance squared     |          |
|          |  | <u> </u> |

| Question<br>number | Answer  | Acceptable<br>Answers | Marks |
|--------------------|---|-----------------------|-------|
|                    | D Perihelion  |                       | 1     |
|                    | The only correct answer is D  |                       |       |
|                    | A is not correct because Aphelio s the point where the Earth is furthest from the Sun                     |                       |       |
|                    | B is not correct because Elongation is a<br>point in the orbit of another planet, as<br>viewed from Earth |                       |       |
|                    | C is not correct because it refers to the days of the year when day and night are of equal length         |                       |       |

# Q5.

| Question number | Answer  | Mark |
|-----------------|---|------|
|                 | (i) C Epicycles                                   | (1)  |
|                 | A is incorrect because it is an observation.      | (1)  |
|                 | B is incorrect because it was proposed by Kepler  |      |
|                 | D is incorrect because it is an ancient idea.     |      |
|                 | (ii) <b>B</b> Elliptical orbits                   |      |
|                 | A is incorrect because it is an observation.      |      |
|                 | C is incorrect because it was proposed by Ptolemy |      |
|                 | D is incorrect because it is an ancient idea.     |      |

# Q6.

| Question<br>number | Answer  | Notes  | Marks |
|--------------------|---|--|-------|
|                    | It made predictions of the positions of the planets easier/quicker to calculate. OR: Explained retrograde motion of planets | Accept: Better<br>predictions<br>Reject: It had the<br>Sun at the centre /<br>didn't have the<br>Earth at the centre | 1     |

| Question<br>number | Answer                              | Notes | Marks  |
|--------------------|-------------------------------------|-------|--------|
|                    | 100<br>10 (or evidence of squaring) |       | 2<br>1 |

## Q8.

| Question<br>number | Answer   | Mark |
|--------------------|--|------|
| (i)                | An explanation that combines identification – application of knowledge (1 mark) and reasoning/justification – application of understanding (1 mark):  Direction of the axial tilt has shifted since the building of the monument (1) so the star in constellation X would be located at a different place in the sky during the solstice now (1) | (2)  |

| Question<br>number | Answer  | Additional guidance   | Mark |
|--------------------|---|---|------|
| (ii)               | 35.4 ÷ 1.38 =<br>25.7 centuries (2570 y) (1)<br>554 BCE (1) | Award full marks for<br>correct numerical answer<br>without working  Accept: BC Accept answers in the<br>range of 560 BCE to<br>484 BCE | (2)  |

| Question<br>number | Answer  | Mark |
|--------------------|---|------|
| (iii)              | An explanation that combines identification – understanding (1 mark) and reasoning/justification – understanding (2 marks):  The Earth's axis points to the pole star (Polaris) rather than the pole of the ecliptic which stays fixed (1) which means that precession causes the Earth's axis to describe a circle round the pole of the ecliptic every 26 000 years (1) and so the Earth's axis will point to different stars (e.g. Thuban/Alderamin) on the circle at different times (1). | (3)  |
